

FME Desktop

FME Desktop provides users with a platform to build workspaces to transform data. It supports 400+ formats and applications within workspaces which can be run again, adjusted or changed to suit varying scenarios and strategic goals.

In FME Desktop, no coding is required, which allows the user to spend more time exploring and utilising data-rich information on its own or take the analysis further by integrating it with other tools like Python.

FME Server

Within FME Server, users can start by building workflows in FME Desktop's drag-and-drop interface and follow this by running them as scheduled or in real-time, in response to events. FME Server is also integrated with many third-party applications so users can build seamless, automated workflows.

FME Cloud

As the hosted version of FME Server, FME Cloud saves users from building and maintaining the infrastructure for an in-house server. FME Cloud is flexible; it can be turned on and off as required and users can expand storage size as they need to, with an unlimited number of engines each server instance can run.

Partner

Product Features & Benefits

Features

Highly scalable functionality

Business built on security and privacy of data

Configurable REST API

Easy installation & simple configuration of automation workflows within the interface

Benefits

Suited to any organisation's automation needs to seamlessly scale up with additional engines

Ensures confidentiality, privacy and trust in your organisation's security of data and information

Providing control over a wide range of FME Server functionality, including clear, readable URLs for requests and responses

Ability for anyone to use from any data user level
